

playing with digital history: making interactive maps

with **Cynthia Heider**, Public
Digital Scholarship Librarian
heider@upenn.edu

who
am i?

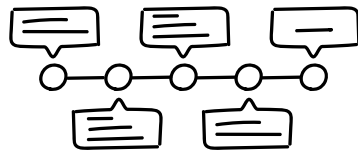

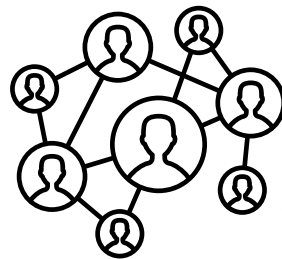

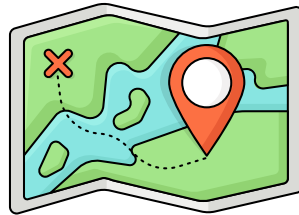

road map

- brief intro to digital history & mapping
- handy terms & principles for visualizing data
- where can you find data?
- hands-on tutorial using Datawrapper

what is digital history?

why do digital history?

- Making technology an integral component of the historian's craft opens **new ways of analyzing patterns in data** and offers means to visualize those patterns, thereby enriching historical research.
- Digital history offers multiple pathways for historians to **collaborate, publish, and share their work** with a wide **variety of audiences**.
- Digital methods help us to **access and share marginalized or silenced voices** and to incorporate them into our work in ways not possible in print or the space of an exhibition gallery.

Sheila Brennan, in "The Inclusive Historian's Handbook"

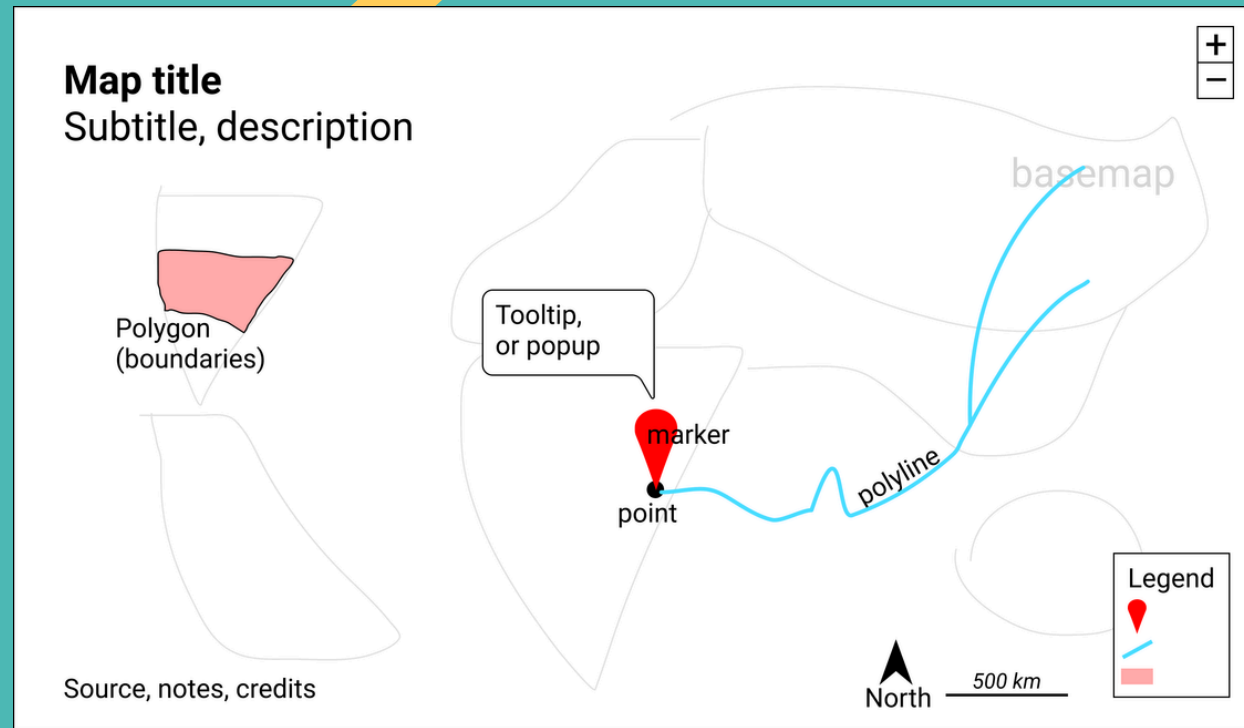

can your data be mapped?

- 
- 36.48, -118.56 (latitude and longitude for Joshua Tree National Park, CA)
 - 2800 E Observatory Rd, Los Angeles, CA
 - Haight and Ashbury Street, San Francisco, CA
 - Balboa Park, San Diego, CA
 - Census tract 4087, Alameda County, CA
 - City of Los Angeles, CA
 - San Diego County, CA
 - State of California

key terms

From "Hands On Data Visualization" by Jack Dougherty and Ilya Ilyankou

key terms

Minimum wage as defined by the state

Minimum wage as defined by the state

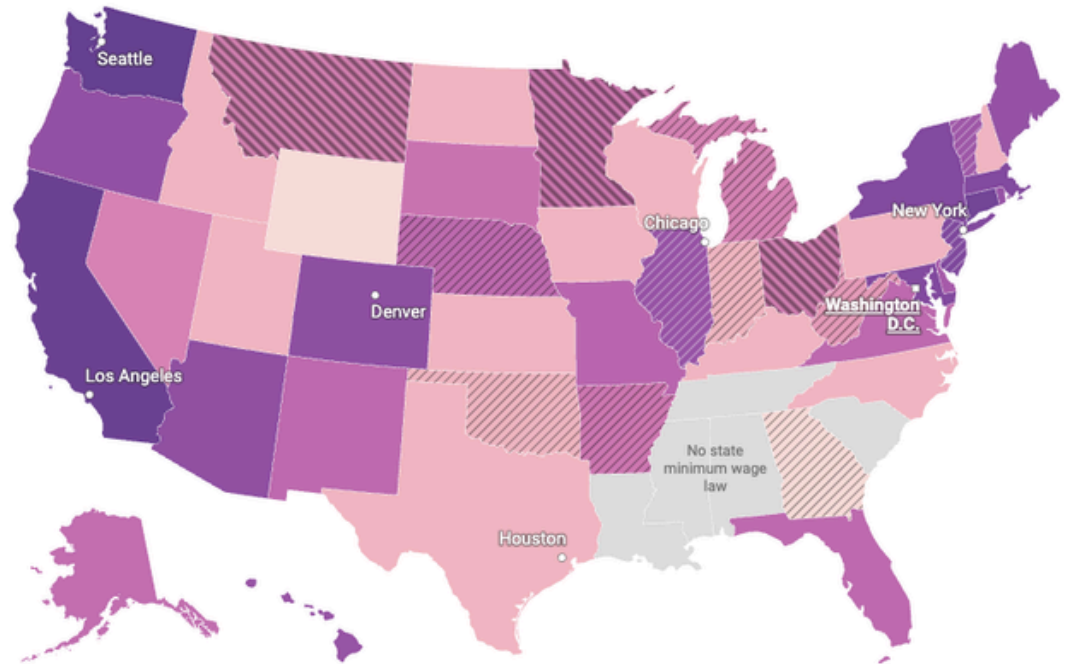

\$5

\$17

Conditions

Number of employees

Revenue/sales

what map type should you choose?

Points or polygons?

- 
- 36.48, -118.56 (latitude and longitude for Joshua Tree National Park, CA)
 - 2800 E Observatory Rd, Los Angeles, CA
 - Haight and Ashbury Street, San Francisco, CA
 - Balboa Park, San Diego, CA
 - Census tract 4087, Alameda County, CA
 - City of Los Angeles, CA
 - San Diego County, CA
 - State of California

map types

LOCATOR

- uses points
- good for showing landmarks and their surroundings as a frame of reference
- most familiar to many people

From "Hands On Data Visualization" by Jack Dougherty and Ilya Ilyankou

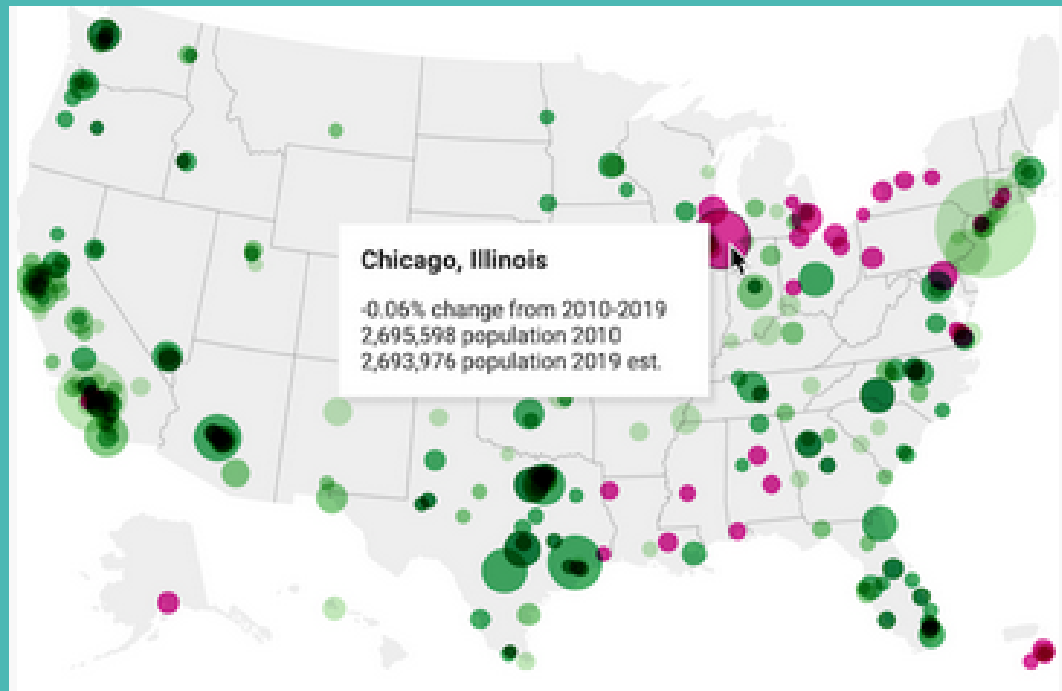

map types

SYMBOL

- uses points
- good for showing information about data for specific locations through variations in size and color

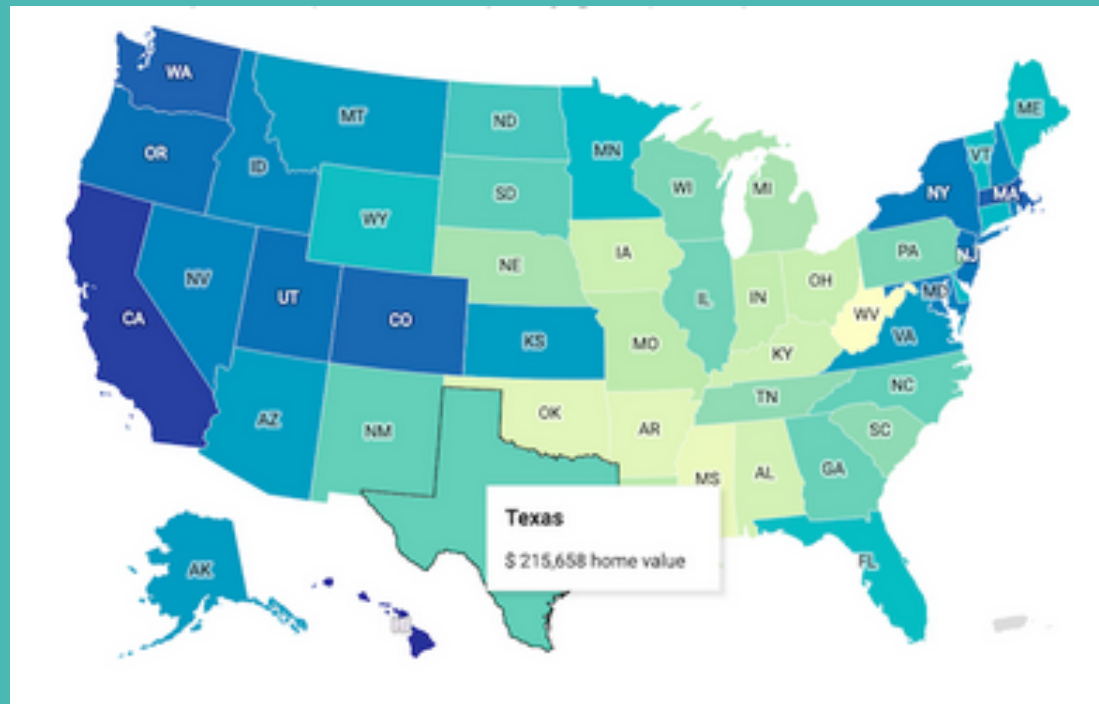

From "Hands On Data Visualization" by Jack Dougherty and Ilya Ilyankou

map types

CHOROPLETH

- uses polygons
- good for showing patterns across geographic areas using different colors to convey information

From "Hands On Data Visualization" by Jack Dougherty and Ilya Ilyankou
